

PRELIMINARY TOKEN VERIFICATION REPORT

BabyDoge balance displayed in wallet screenshot | Prepared 31 July 2026

Wallet supplied	Anonymised for public release
Network indicated	BNB Smart Chain / BEP-20
Scope	Screenshot-based verification against the official Baby Doge Coin reference
Status	Preliminary - token contract inside the wallet has not been independently extracted

1. Executive finding

The balance shown in the screenshot cannot be treated as verified official Baby Doge Coin. The visible amount is approximately 183,632,337,222,369,740,799,999,999,985 units, while the official Baby Doge Coin contract reports a maximum total supply of 420,000,000,000,000,000 tokens and uses 9 decimals.

Read literally as tokens, the displayed amount is about 437.2 billion times the official maximum supply. Even if the displayed figure were raw contract units and divided by 10^9 , it would still represent approximately 437 times the official maximum supply.

Therefore, at least one of the following must be true: the wallet is showing a different or cloned BEP-20 token, the token metadata/decimal configuration is incorrect, or the wallet interface is displaying the balance incorrectly. The screenshot alone does not prove ownership of genuine, tradable BabyDoge.

2. Visual evidence

Figure 1. Wallet screenshot crop supplied by the user. The interface shows the name "BabyDoge (BEP20)" and a very large balance, but it does not display the token contract address or a recognised USD valuation.

3. Official reference data

Reference item	Verified public reference
Official BNB Chain contract	0xc748673057861a797275cd8a068abb95a902e8de
Decimals	9
Maximum total supply	420,000,000,000,000,000 BabyDoge
Displayed wallet figure	~183,632,337,222,369,740,799,999,999,985
Literal ratio vs. max supply	~437,219,850,529 times the maximum supply
Ratio after correcting by 9 decimals	~437.22 times the maximum supply

The public BscScan token page identifies the official contract, its 9-decimal configuration and maximum supply. CoinGecko independently lists the same contract address. These references establish the official comparison baseline.

4. Why the name and logo are not evidence

A BEP-20 token creator can choose a name, ticker and logo resembling an established asset. A wallet application may then display that metadata even when the underlying smart contract is unrelated. Authenticity is determined by the contract address, not by the visible token name, icon or balance.

The absence of a USD price in the screenshot is an additional warning sign, but it is not conclusive by itself. A legitimate token may temporarily lack price data in a particular wallet application.

5. Required verification before assigning any value

1	Open the BabyDoge token details and copy the exact contract address.
2	Confirm that it matches the official contract character-for-character.
3	Check the wallet balance directly on BscScan under that exact contract.
4	Verify active DEX liquidity and simulate a small sale without granting unlimited approval.
5	Review transfer restrictions, taxes, blacklist functions and honeypot indicators.

6. Conclusion

The screenshot does not establish a genuine Baby Doge Coin holding. The displayed quantity is mathematically incompatible with the official supply, including after applying the official 9-decimal conversion. The asset should therefore be classified as unverified and presumed non-authentic or incorrectly displayed until the underlying contract address is obtained and matched to the official contract. Its DEX value should be treated as zero until liquidity and sellability are independently confirmed.

Limitation: This is a preliminary OSINT assessment. Definitive identification of the exact asset requires its contract address or an on-chain token transaction.
